Google versus Google Scholar for finding scholarly resources

[female narrator]

Why would you use Google Scholar instead of Google? This video will explain what Google Scholar is and when you should use it.

We all use Google to search for information. It’s easy to use and you can find lots of information on any topic imaginable. However, because Google searches the entire Internet, not all the results you get will be suitable for your academic work. You don’t always get reliable or worthwhile information when you search Google. You might not be able to find the author of the resource. Or the information might not be based on academic research. Or the information might be biased in favour of one view or another. But Google Scholar makes it easy to filter your results to resources that are of academic quality.

The resources you will find in Google Scholar are scholarly, which means that they are from academic publishers and educational and government organisations. These scholarly resources include books and academic journal articles, conference papers, and reports from reputable government organisations and research institutes.

To make the most of Google Scholar, search it from the RMIT Library home page. Log in using your RMIT login and password. Search using your topic key words.

When you find an item you want, click on the ‘FindIt @ RMIT’ link to access the full text.

That’s why you should use Google Scholar for your academic research.
